

Current Practice Unstructured Grid CFD Results for 3rd AIAA High Lift Prediction Workshop

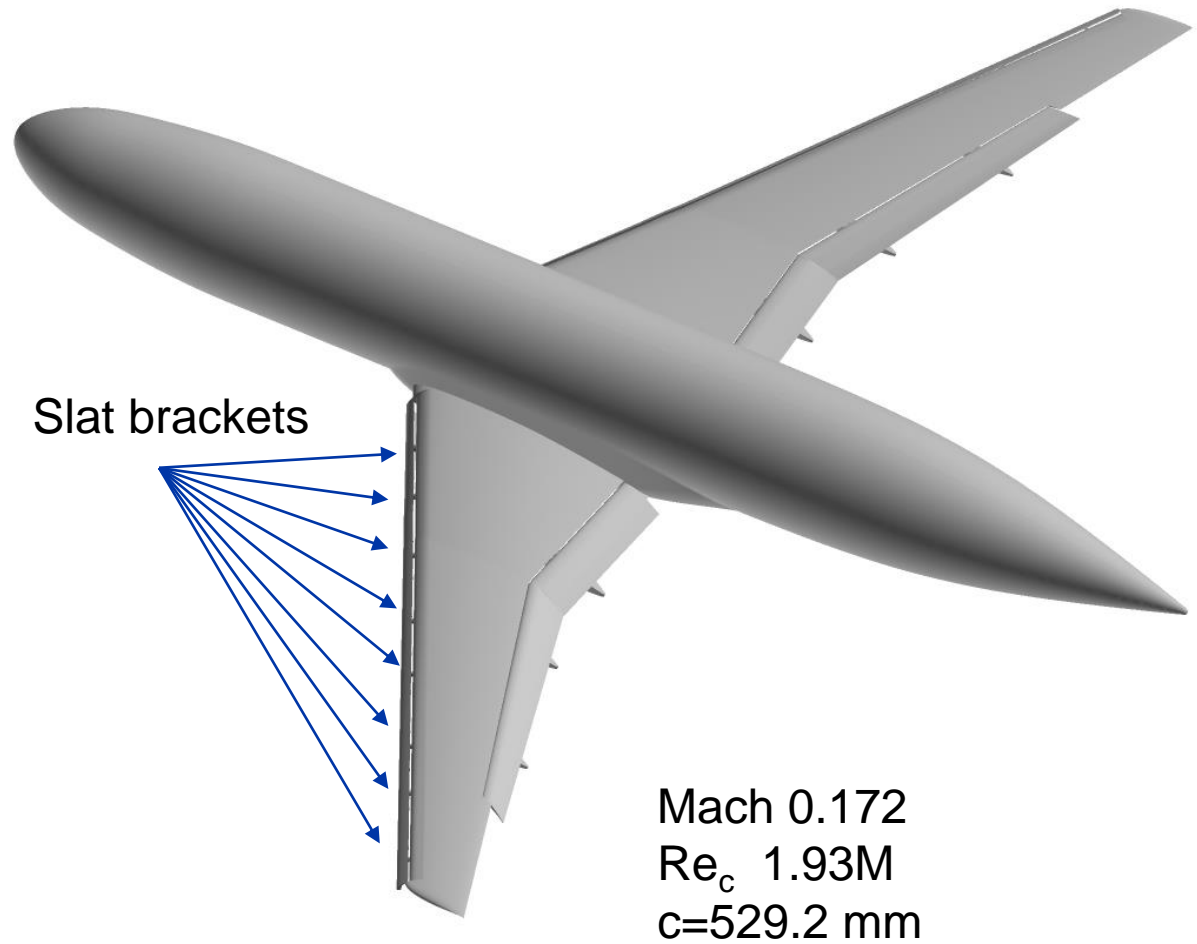

Andrew Cary, Mohamed Yousef, Mori Mani, and Pei Li
Boeing Research and Technology

January 12, 2018

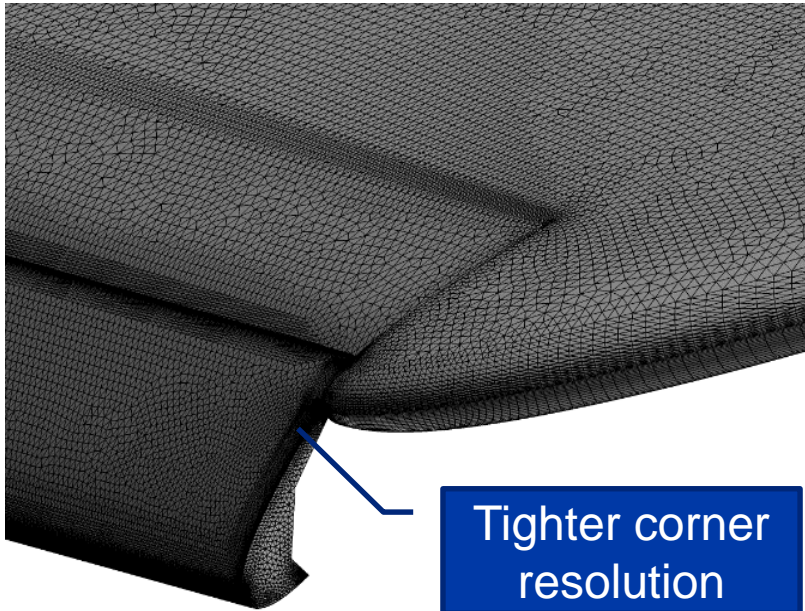

Overview

- **Completed series of simulations based on High Lift Prediction Workshop 3 cases to assess flow solvers, committee-provided grids, and turbulence models**
 - Specific focus on JAXA Standard Model without pylon (Case 2a)
 - Emphasis is on comparing CFD results, not comparison to experiment
 - CFD Solvers: BCFD, CFD++, GGNS
 - Grids: JAXA (D), ANSA (E), VGRID (C)
 - Turbulence Models: Spalart-Allmaras (SA), SA-QCR, SA-RC-QCR
- **Principal results:**
 - Different CFD codes on same/similar meshes with same turbulence model generate similar results
 - Mesh and turbulence model differences lead to different results
 - Once significant flow separation occurs, families of pseudo-solution attractors appear that are associated with flow separation from different slat brackets

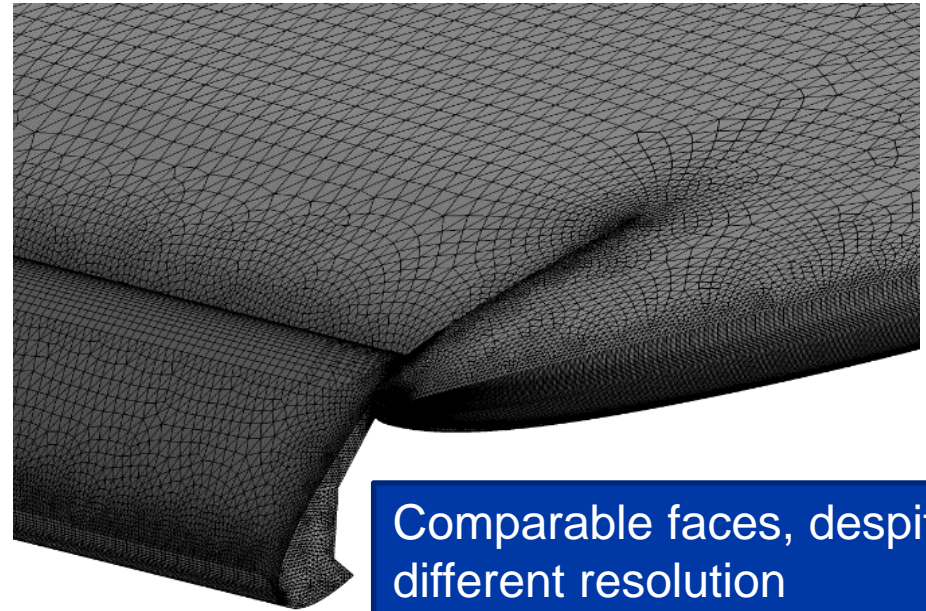

JSM Case overview (case 2a)

Mesh Comparison - Surface

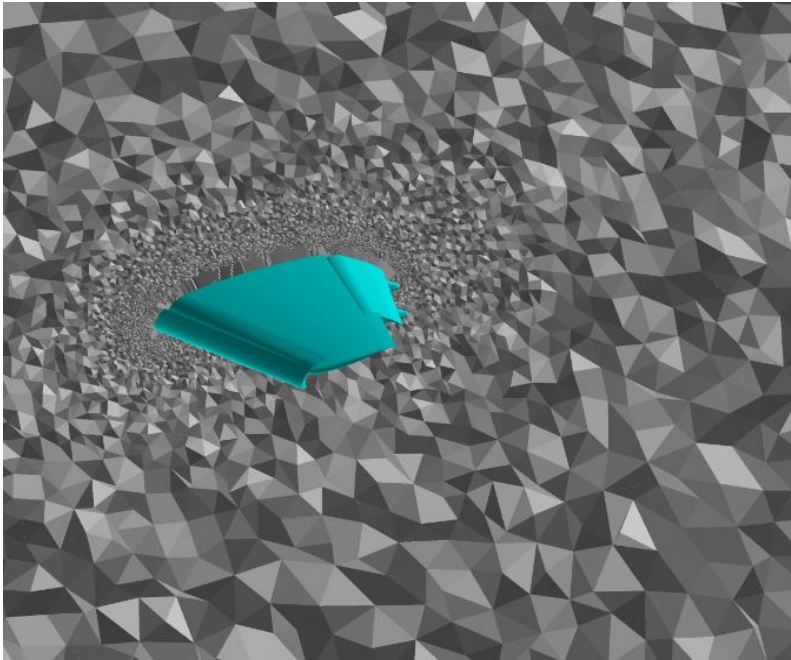

JAXA Grid (D)

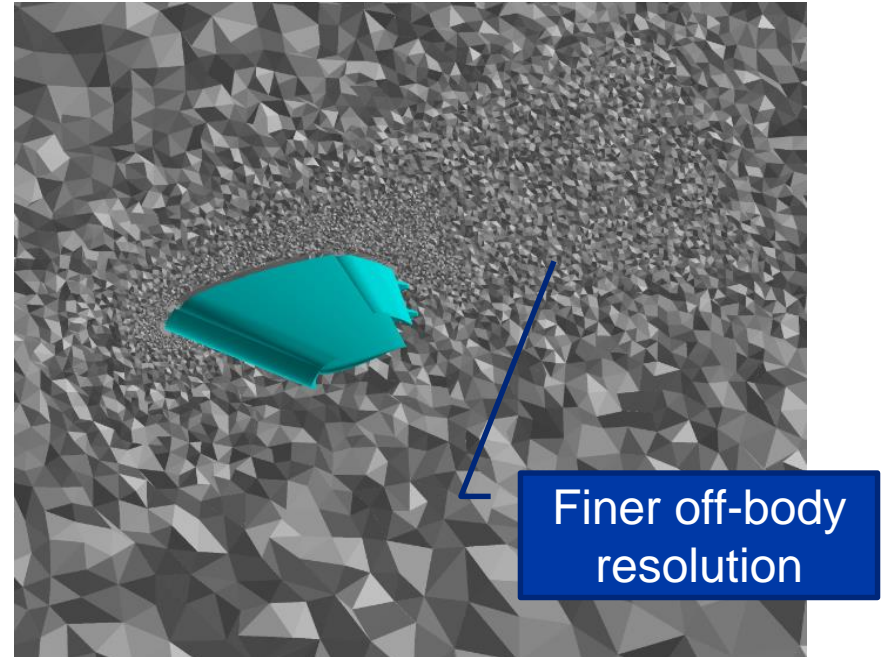

ANSA Grid (E)

Grid Series	Grid Type	Number of Volume Cells	Number of Volume Nodes	Wall Faces	Number of Hex/Prism cells
C1 - VGRID	Tetrahedra	96.6M	16.4M	0.93M	N/A
D – JAXA	Mixed Element	120M	50.4M	1.49M	81.3M
E – ANSA	Mixed Element	107M	51.9M	1.64M	79.5M
E2 - ANSA (fine)	Mixed Element	165M	82.8M	1.81M	129M

Mesh Comparison - Volume

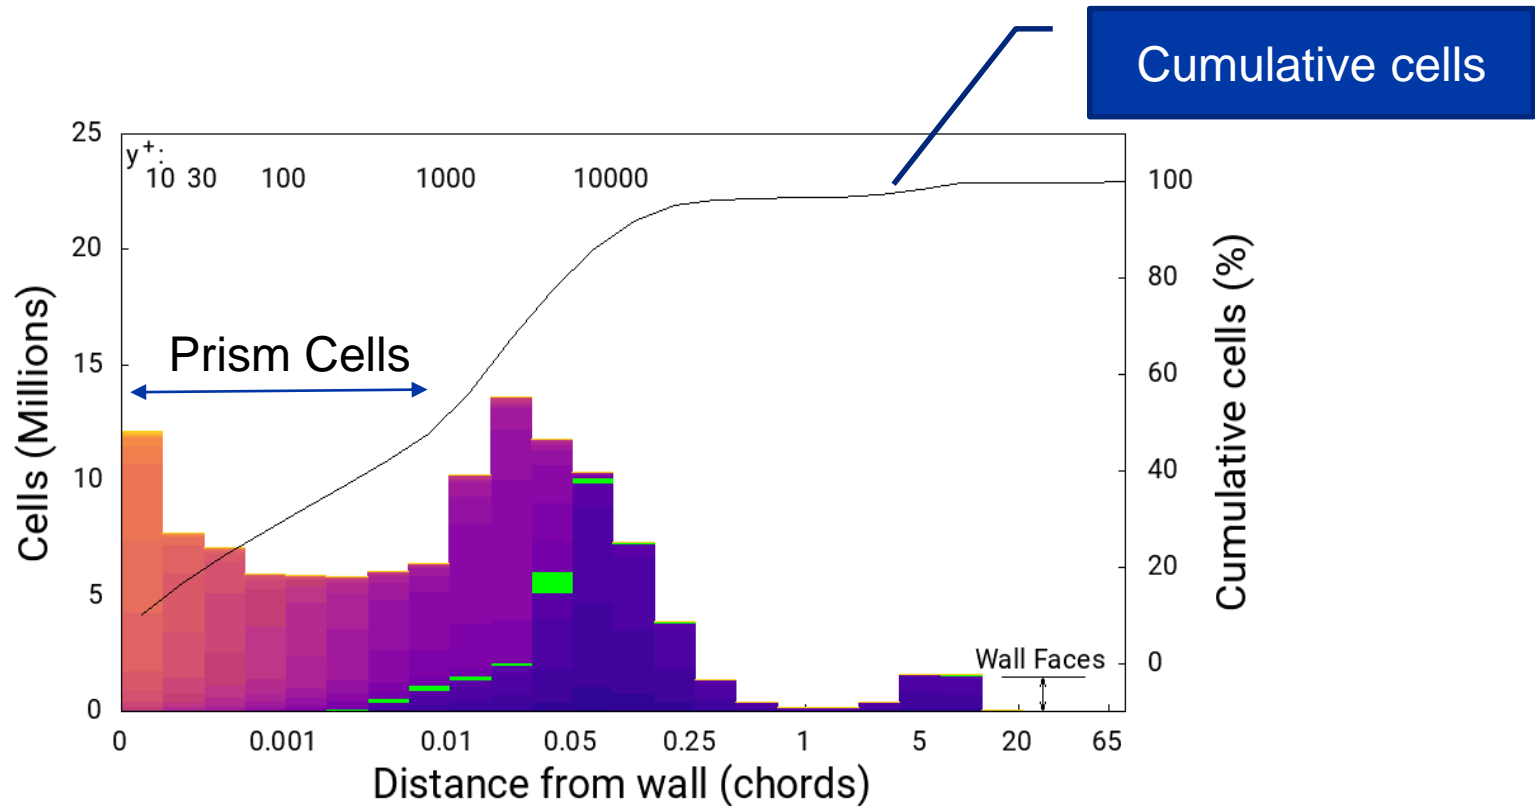

JAXA Grid (D)

ANSA Grid (E)

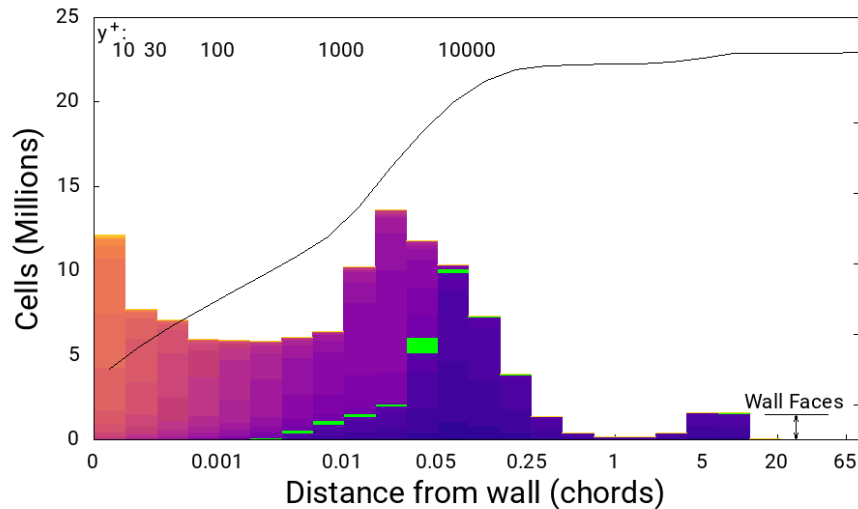

Grid Series	Grid Type	Number of Volume Cells	Number of Volume Nodes	Wall Faces	Number of Hex/Prism cells
C1 - VGRID	Tetrahedra	96.6M	16.4M	0.93M	N/A
D – JAXA	Mixed Element	120M	50.4M	1.49M	81.3M
E – ANSA	Mixed Element	107M	51.9M	1.64M	79.5M
E2 - ANSA (fine)	Mixed Element	165M	82.8M	1.81M	129M

Volume Mesh Statistics

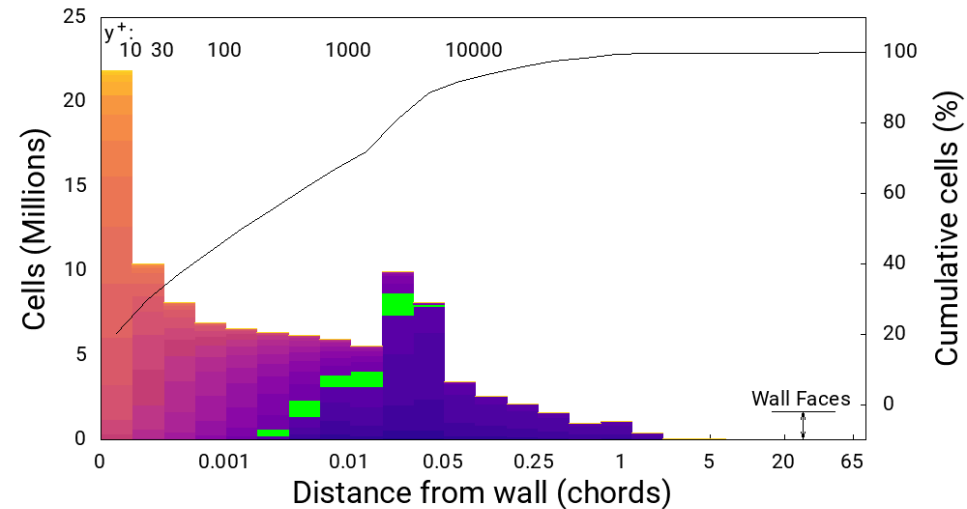

- Bins of wall distance (geometric growth)
- Cells colored by aspect ratio (green division is AR=2)
- 35% cells are within y^+ approx. 50
- 80% cells are within 5% MAC of body

Mesh Comparison – Volume Metrics

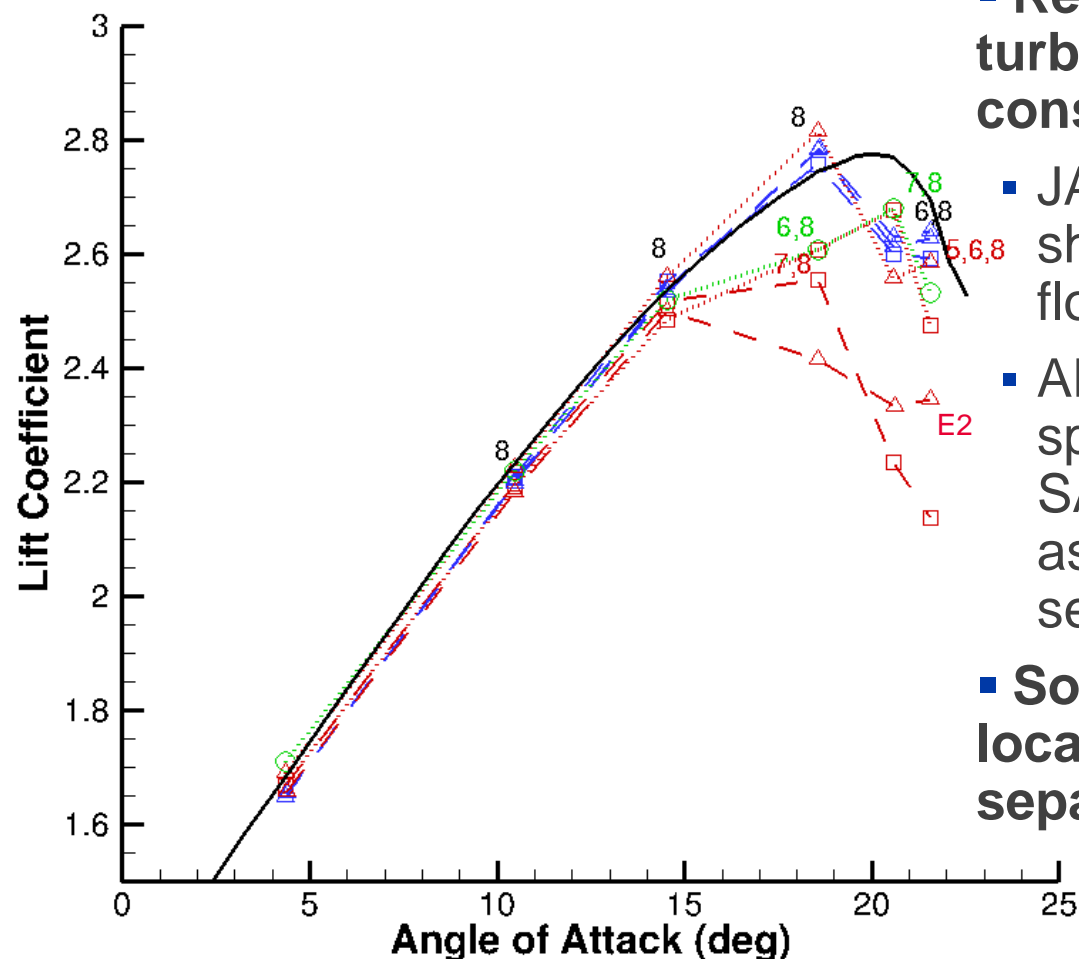

JAXA Grid (D)

ANSA Grid (E)

- ANSA grid packs more cells in lower part of boundary layer
- ANSA grid has less overall resolution between 5% and 25% chord, but more resolution at about 1 chord
- Image does not reflect spacing/distribution on surface

Lift Coefficient: Result Consistency

- **Results with same grid and turbulence model generally consistent**

- JAXA (SA-RC-QCR) results show strong consistency across flow solvers, users

- ANSA results show larger spread for both SA-QCR and SA-RC-QCR; primarily associated with slat bracket separation

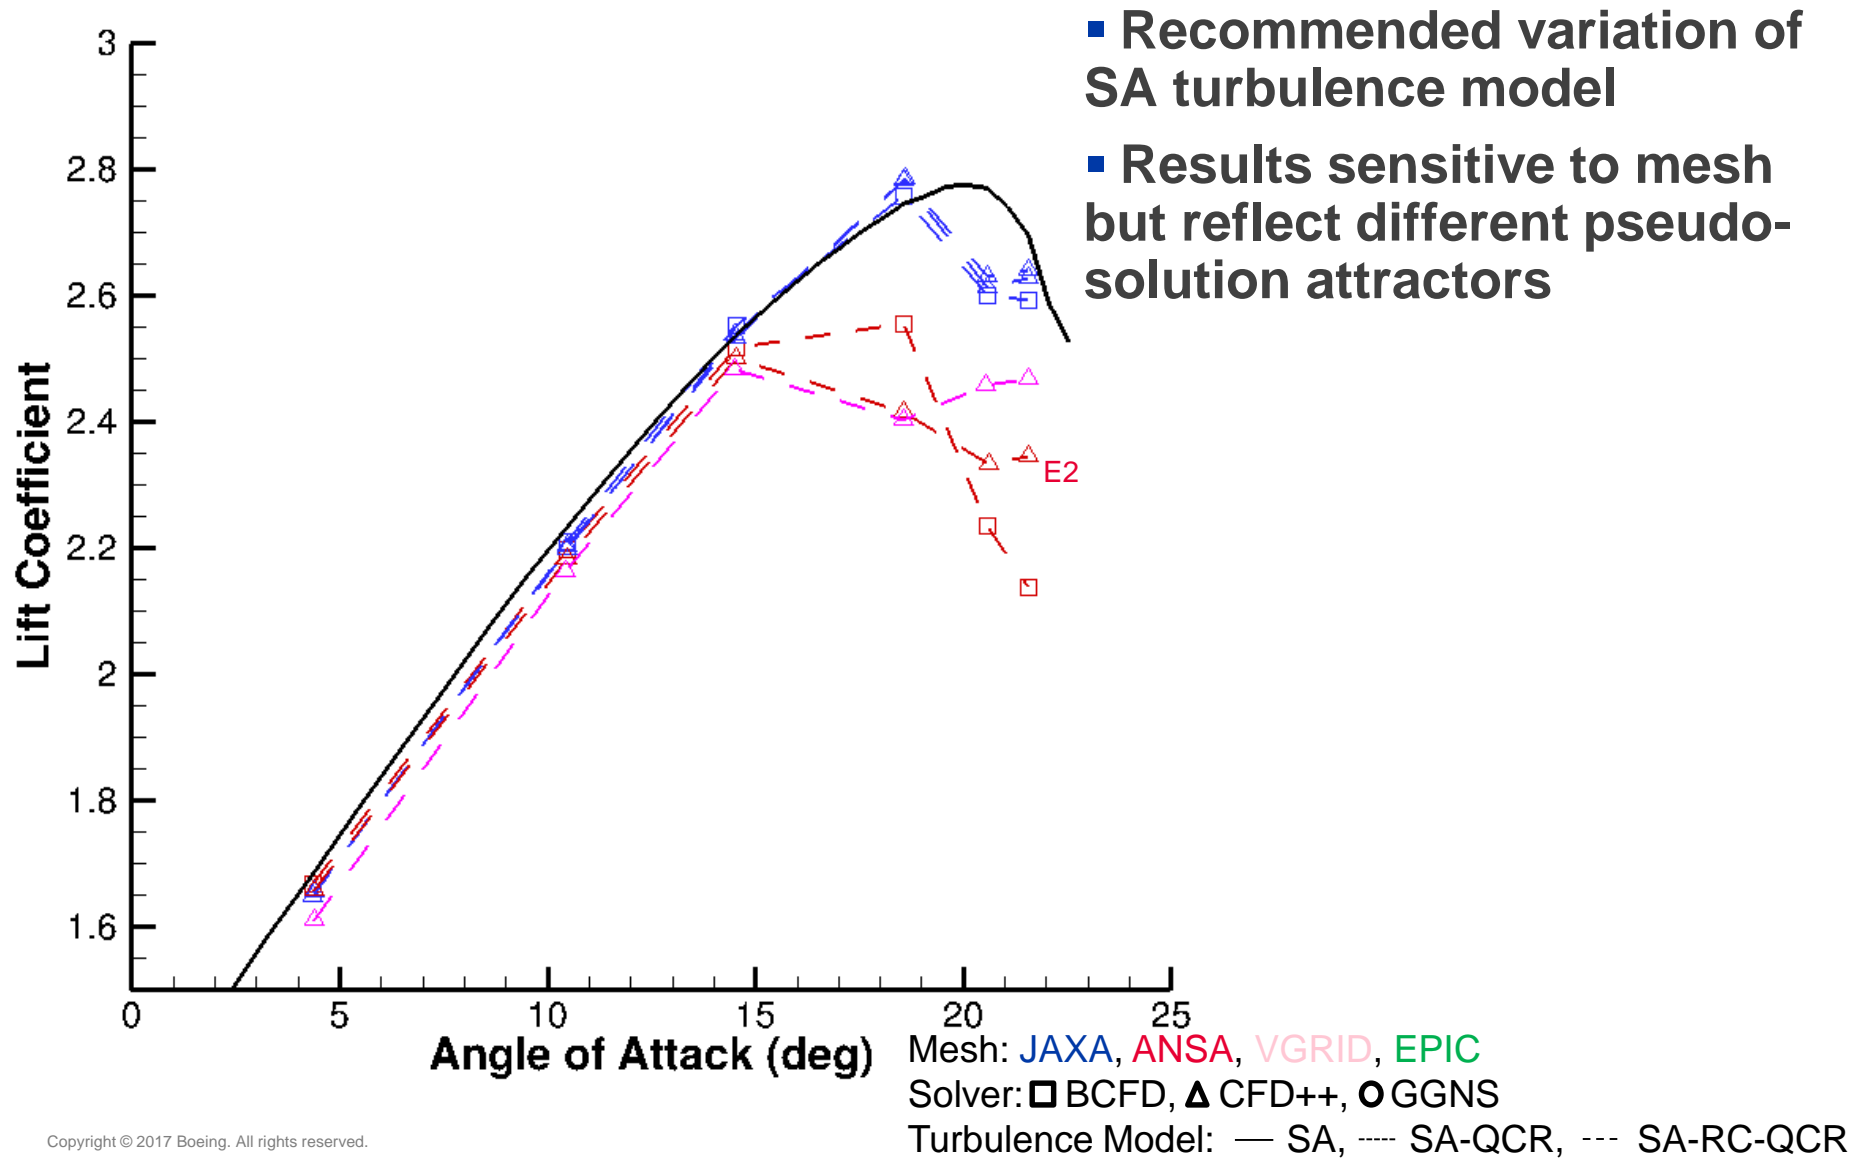

- **Solutions cluster based on location of slat bracket separations (annotation)**

Mesh: JAXA, ANSA, VGRID, EPIC

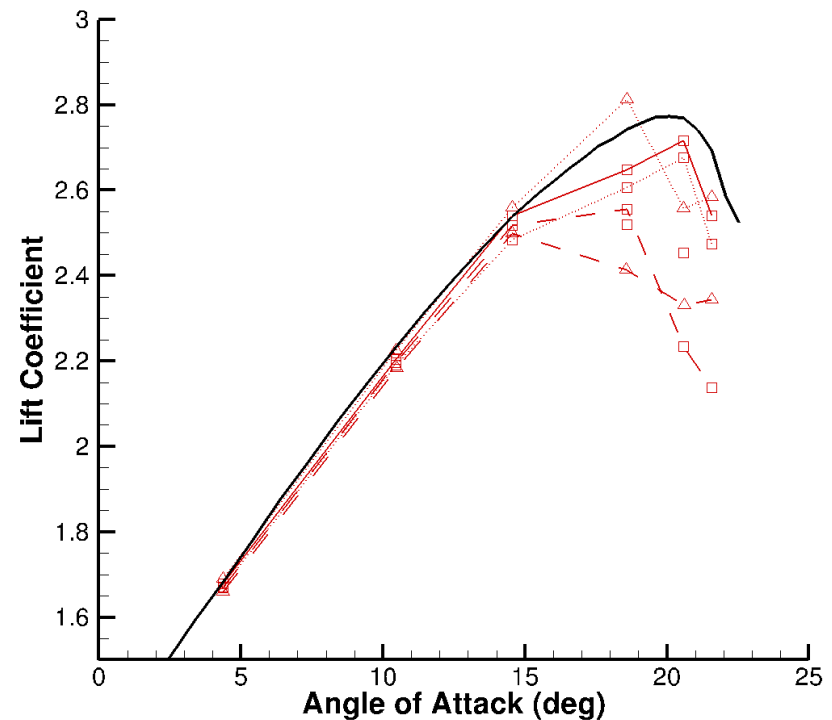

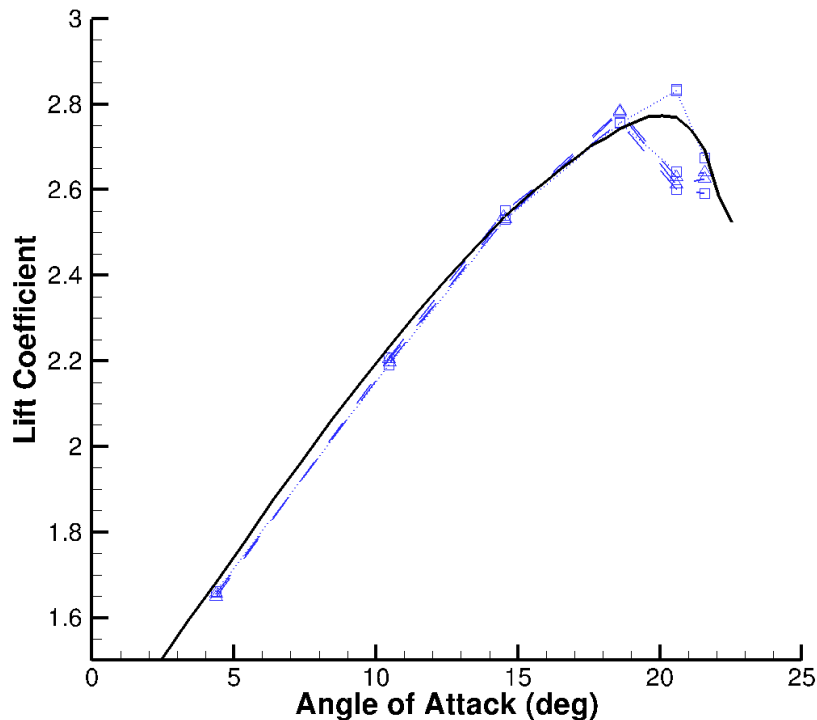

Solver: ■ BCFD, ▲ CFD++, ● GGNS

Turbulence Model: — SA, ---- SA-QCR, --- SA-RC-QCR

Lift Coefficient: SA-RC-QCR

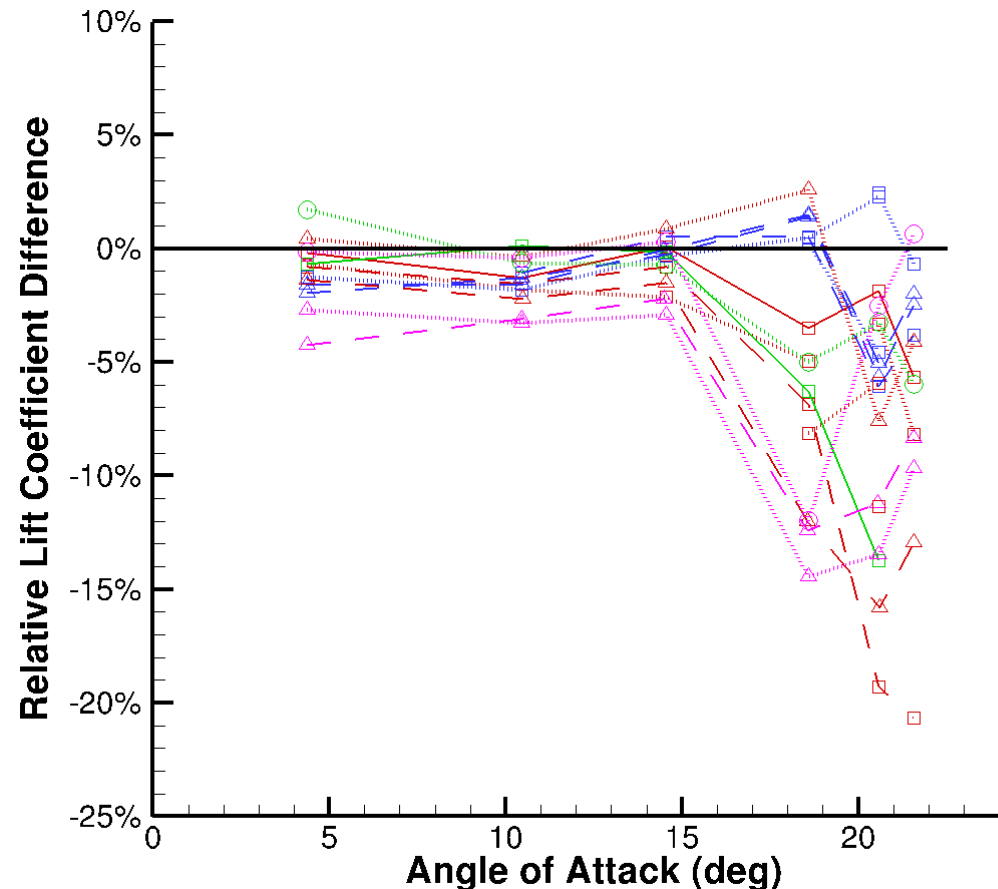

Lift Coefficient: Grid Sensitivity

- ANSA mesh appears more sensitive to turbulence model than JAXA mesh
- Solution variation with iteration less than symbol size; typically 3-5 orders of magnitude residual convergence

Lift Coefficient – Overall Comparison

- General agreement until significant flow separation
- Consistent trends for given mesh (multiple flow solvers and turbulence models)
 - JAXA grid particularly tightly clustered
 - Adapted mesh results similar until final angle of attack
- Large spread near key areas (CLmax, AoAmax) limits engineering usefulness in these regions

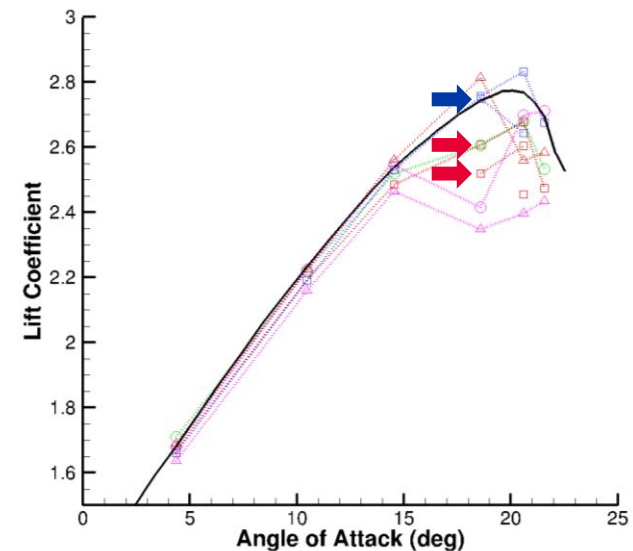

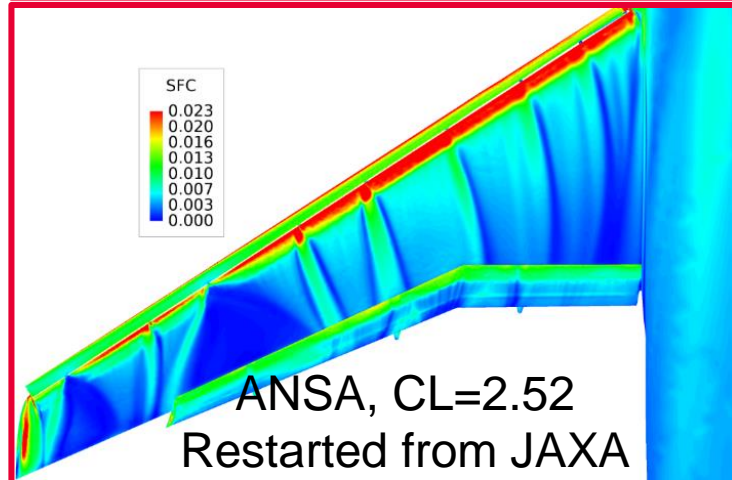

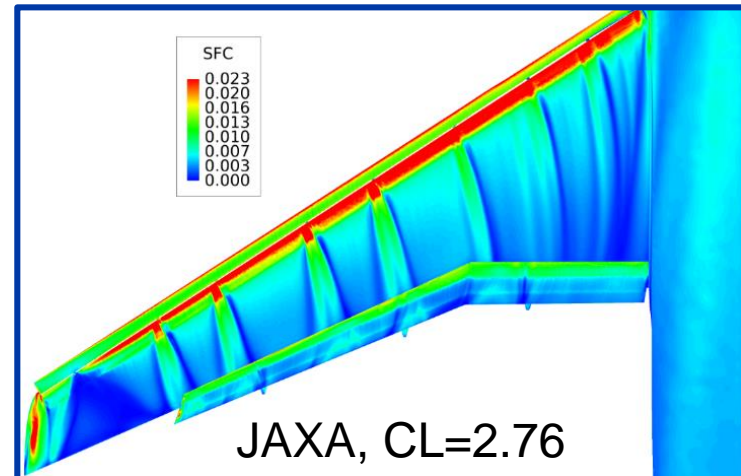

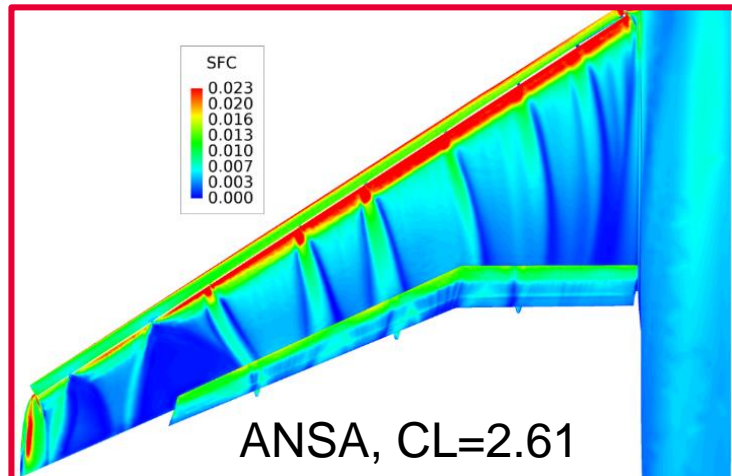

Relative difference from experimental data to facilitate comparison

Mesh: JAXA, ANSA, VGRID, EPIC

Solver: ■ BCFD, ▲ CFD++, ● GGNS

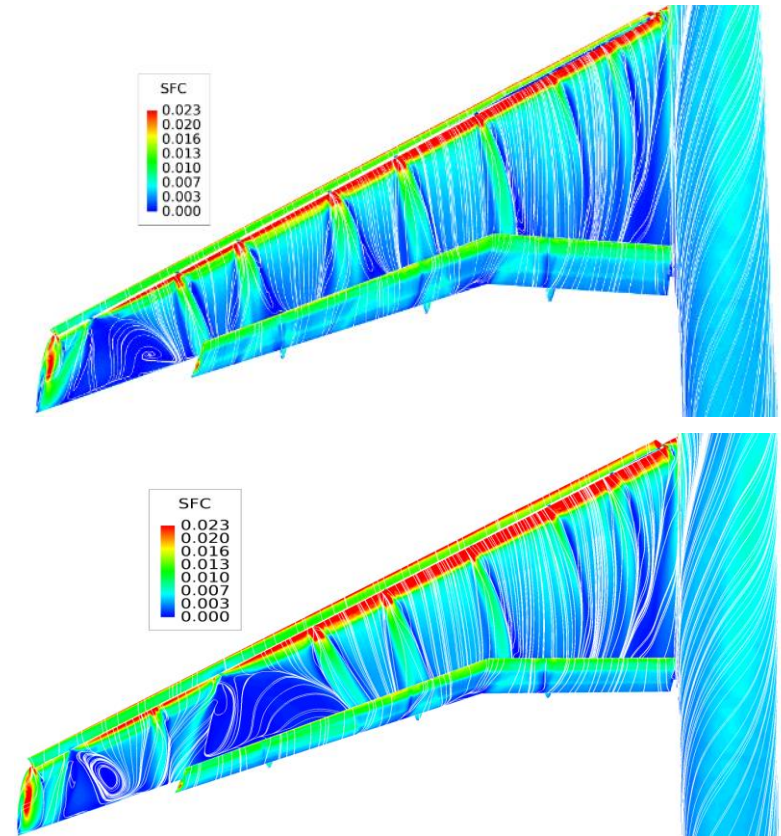

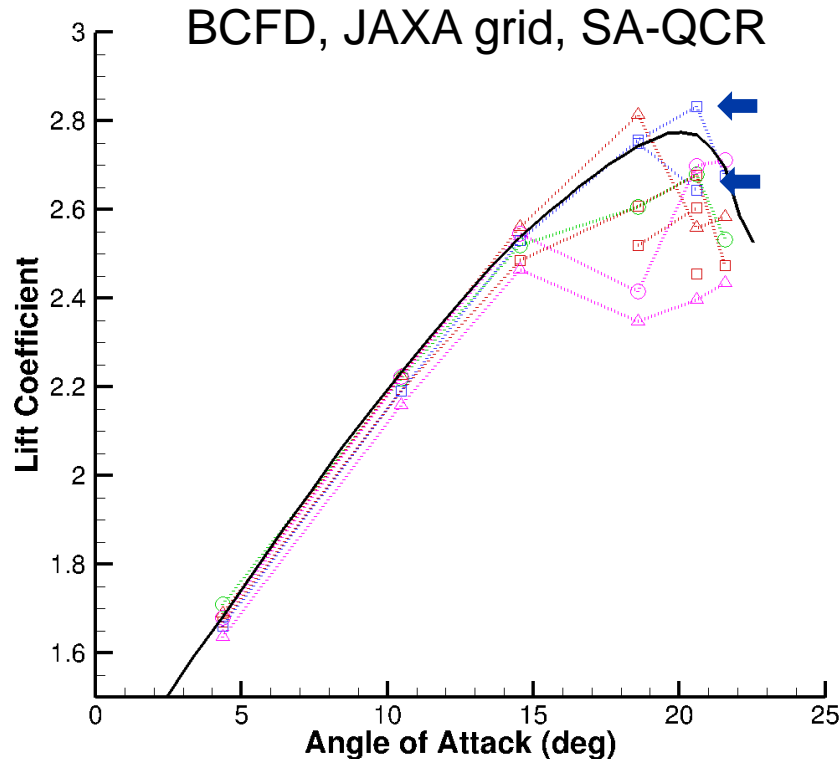

Turbulence Model: — SA, ---- SA-QCR, --- SA-RC-QCR

Pseudo-Solution Robustness (soln interp)

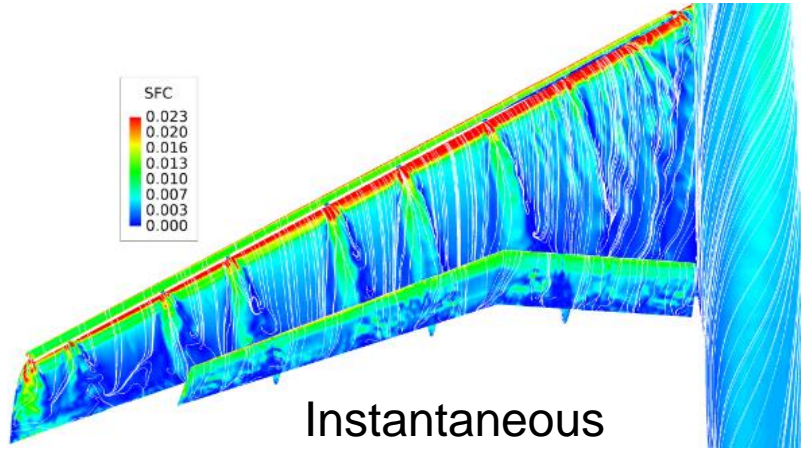

- BCFD SA-QCR, 18.58°
- Interpolate JAXA solution onto ANSA grid and reconverge

Pseudo-Solution Robustness (change CFL)

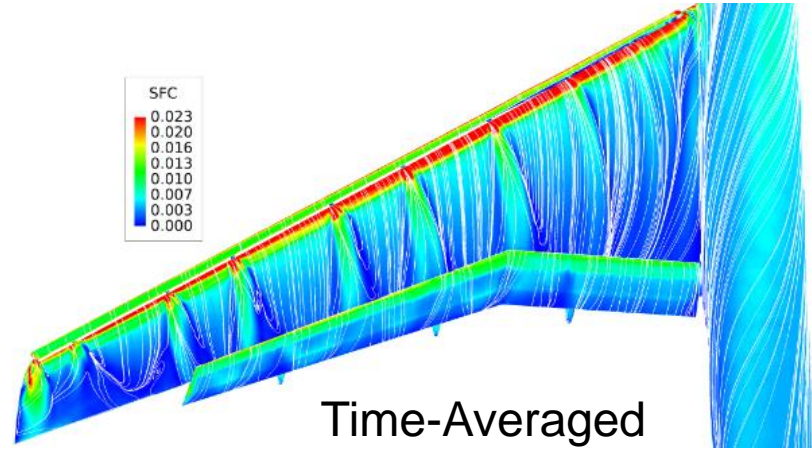

- Changing CFL number switches pseudo-solution sometimes (indication of strength of attractor)
- Need flow solver convergence to assess grid, turbulence model, but what if multiple solutions?

Time-Accurate Simulation Impact

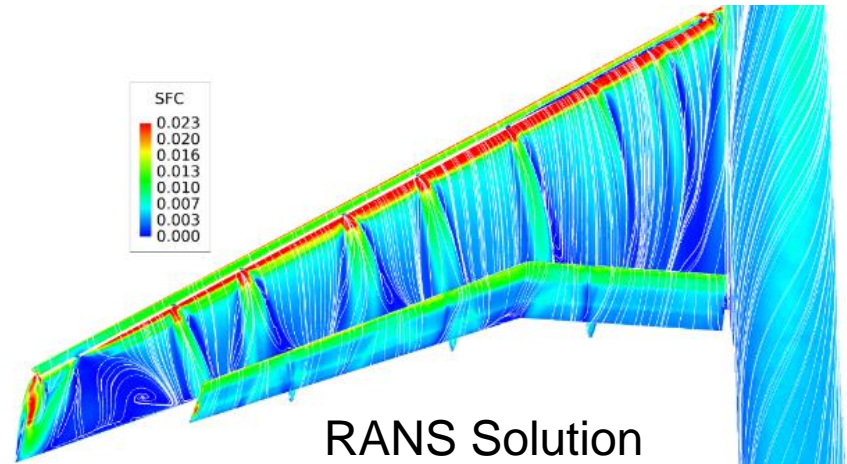

Instantaneous
Solution

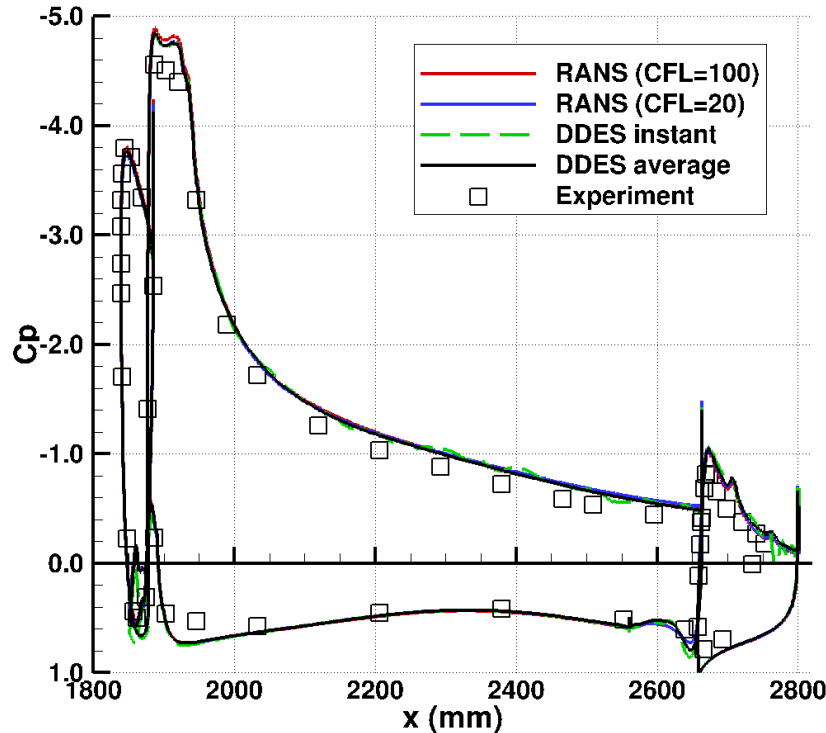

Time-Averaged
Solution

- Start time-accurate DDES solution on JAXA grid, SA-QCR, 20.59°
- Time-averaged solution shows no separation
- Lift comparable to RANS

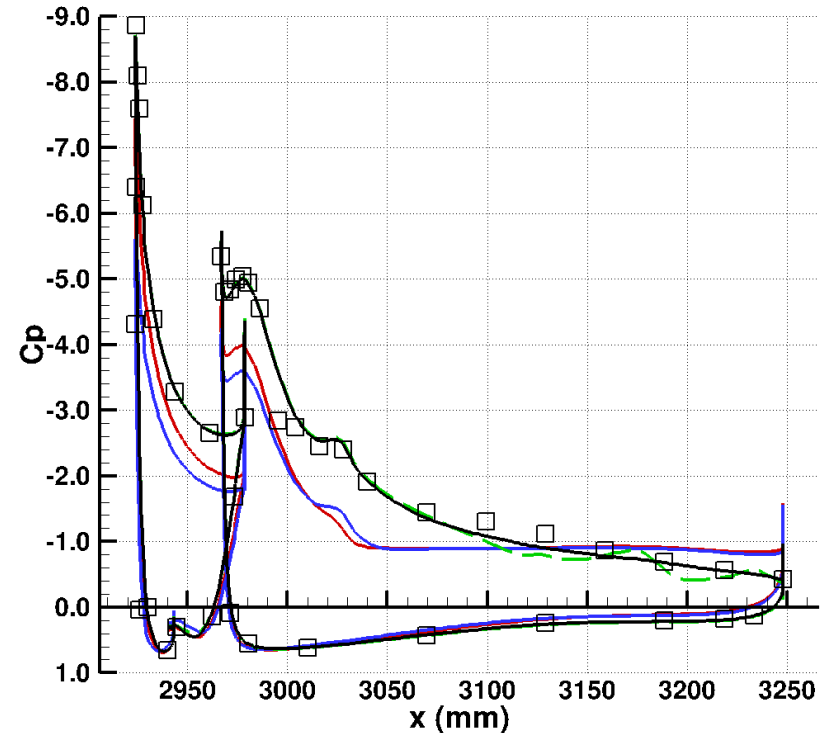

RANS Solution

Time-Accurate Simulation Pressure Distribution

Inboard

Outboard

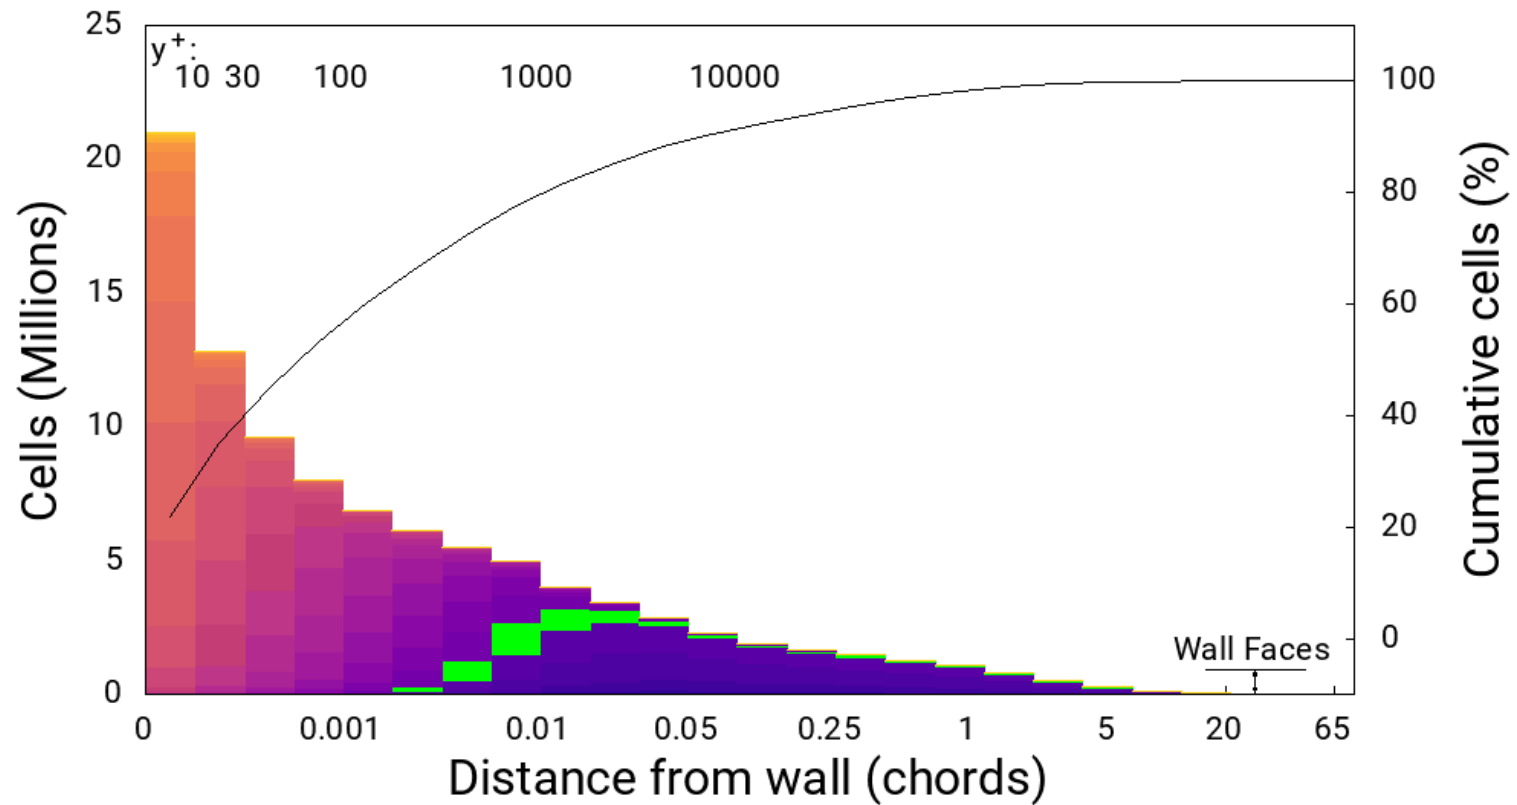

- Inboard pressure cut (A-A) compare well to RANS; show little variation
- Outboard pressure cut (H-H) shows average flow is attached; improved comparison to experimental measurement

Summary

- **Effort focused on current technology flow solvers with committee-provided meshes and standard turbulence models**
- **Generally good agreement among solvers for same grid and turbulence model**
- **Grid convergence has not been assessed**
 - Significant amount of grid very close to aircraft
 - JAXA committee-provided grid shows less variation in results than ANSA grid, but had less off-body resolution
- **Solver identifies multiple pseudo-solutions that can sometimes be perturbed to different attractors**
 - Interpolation of new solutions
 - Change CFL number
- **Running time accurate may lead to improved comparison to experiment**

C-VGRID mesh

EPIC mesh
